PROFESSIONAL SUMMARY

Code-first Applied AI / LLM Engineer building reliable AI automation with Python, FastAPI, structured outputs, tool calling and retrieval workflows. Focused on turning prototypes into controlled systems through deterministic guardrails, evaluation, offline testing and safe failure handling. Currently deepening production operations, observability and scaling skills.

EXPERIENCE & SELECTED PROJECT

Independent Applied AI Engineering Projects

Warsaw, Poland | Feb 2025 - Present

Compliance Decision-Support Service | Python, FastAPI, Pydantic, Groq API, pytest, uv

- Built a typed API that combines deterministic compliance policies with optional LLM-assisted analysis of synthetic transaction data.
- Designed static-first routing and a safe-merge policy so an LLM cannot weaken critical rule-based decisions; uncertain or unavailable provider paths require human review.
- Implemented validated structured outputs, strict request schemas, timeouts, bounded retries, typed transport errors and privacy-aware logging boundaries.
- Isolated external network access through dependency injection and mock clients; maintained 46 passing offline tests plus a separately enabled live integration test.
- Documented the decision pipeline, failure behavior, test strategy and synthetic-data privacy constraints in a reproducible Python 3.12 project.

ADDITIONAL APPLIED AI WORK

- Prototyped RAG workflows, tool-calling integrations and multi-agent patterns for decomposing planning, execution and verification responsibilities.
- Explored browser automation and API-driven workflows, with emphasis on explicit permissions, bounded execution and human approval for sensitive actions.
- Use AI coding tools to accelerate implementation while validating generated changes through code review, automated tests and documented acceptance criteria.

TECHNICAL SKILLS

Applied AI: LLM integration, structured outputs, tool calling, RAG, agentic workflows, prompt design, evaluations, guardrails

Engineering: Python, FastAPI, Pydantic v2, asynchronous APIs, REST, dependency injection, pytest

Reliability: deterministic routing, safe fallback, timeout and retry handling, offline test isolation, privacy-aware logging

Data & Delivery: PostgreSQL, Redis, Docker, Git, uv, CI/CD fundamentals

LANGUAGES
