

Authorized to work in Poland	Warsaw: onsite / hybrid	Worldwide: remote	Relocation: with employer support
------------------------------	-------------------------	-------------------	-----------------------------------

PROFILE

Code-first Applied AI and Python engineer building deployed LLM-enabled products with FastAPI, TypeScript and structured, testable pipelines. Hands-on work includes deterministic guardrails, RAG, multi-provider orchestration, cost controls, streaming APIs and AI-assisted development with Codex and Claude Code. Strong focus on explicit failure handling, privacy and documented architectural trade-offs.

SELECTED INDEPENDENT PROJECTS | 2026

SentinelAI - Transaction Risk & Compliance Automation

[GitHub](#) | [Live demo](#)

- Python | FastAPI | Pydantic v2 | Pandas | Groq | SSE | Docker
- Built an end-to-end prototype that filters synthetic transaction streams with deterministic risk rules before optional LLM-assisted adjudication.
 - Implemented structured verdict parsing, model fallback, SHA-256 chained audit records, live SSE progress and automated case tickets, reports and notification drafts.

RepoLens - Multi-Provider Repository Analyzer

[GitHub](#) | [Live demo](#)

- Next.js | TypeScript | OpenAI | Anthropic | Groq | Ollama | Docker | CI
- Built a repository-analysis workflow with file filtering, four context-optimization levels and three chunking strategies, including map-reduce synthesis for large codebases.
 - Added four LLM providers, SSE progress, token/cost estimates, input hardening, secret redaction, rate limiting, Docker packaging and CI checks.

Compliance MVP - Static-First Decision Support Service

[GitHub](#)

- Python 3.12 | FastAPI | Pydantic v2 | Groq | pytest | uv
- Designed a typed pipeline where deterministic policies retain priority and the LLM can enrich or escalate decisions but cannot weaken a static risk flag.
 - Implemented safe merge behavior, fail-closed provider fallback, dependency-injected network isolation and an offline test suite with opt-in live integration testing.

AI Prompt Orchestrator - Cost-Governed Agentic Planning

[GitHub](#) | [Live demo](#)

- Python | FastAPI | Next.js | TypeScript | Groq | Pydantic v2
- Created a three-stage clarification, resolution and synthesis workflow that converts a raw idea into a validated technical specification and ordered build plan.
 - Separated low- and high-cost models, tracked token spend and enforced a weekly USD budget guard; documented the persistent-process requirement of in-memory state.

TECHNICAL SKILLS

Applied AI	LLM integration, RAG, structured outputs, multi-agent workflows, prompt orchestration, guardrails
Engineering	Python, FastAPI, Pydantic v2, TypeScript, Next.js, REST, async APIs, PostgreSQL, LangChain
Reliability	pytest, dependency injection, deterministic routing, safe fallback, timeouts, retries, cost controls
Delivery & tools	Git, Docker, GitHub Actions, Vercel, Codex, Claude Code

LANGUAGES

Russian - Native
English - Upper-Intermediate
Polish - Upper-Intermediate

EDUCATION

General Secondary Education
Expected completion: 2027 | Warsaw, Poland
